

-I picked these specific parts because they were cheap but also very high in quality. Some of the examples of this would be the CPU because 3.6 Ghz is good for tasks you want to do like gaming and general work. It has a general good performance and is pretty fast.

-I tried prioritizing the cost of the equipment and the quality of the performance because I wanted a cheap budgeted pc build that was supposedly under \$1000 dollars so I can save it for future upgrades and also have these cheap parts in high quality. Not crappy cheap pc parts that aren't in good use, but in reasonable pricing.

-I encountered difficulties with this range because I wanted to find high quality performance parts that were maybe under half \$1000. I tried to add those, but it wasn't keeping up with the total range and adding up the compartments so I just chased cheap, high quality pc parts.

-It would generally be a good build and wouldn't necessarily be a Horrible build because, the compartments were purchased under a budget but in high performance quality and so that everything works generally well and processing like games and general working tasks.

Compatibility: [See details](#) below. Estimated Wattage: 159W
